

Project 1

Lu Beyer

Overview:

I'm reading data from a text file and organizing into a usable csv with excluding irrelevant information. This data is based on chess rankings with several calculated fields.

```
#load tidyverse  
library(tidyverse)
```

```
## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --  
## v dplyr      1.1.4      v readr      2.1.5  
## v forcats    1.0.0      v stringr   1.5.1  
## v ggplot2    3.4.4      v tibble    3.2.1  
## v lubridate  1.9.3      v tidyr     1.3.1  
## v purrr      1.0.2  
## -- Conflicts ----- tidyverse_conflicts() --  
## x dplyr::filter() masks stats::filter()  
## x dplyr::lag()     masks stats::lag()  
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

```
#read txt as a string  
test <- read_file("tournamentinfo.txt")
```

```
#split lines delim by "---"  
x <- str_split(test, "-----")
```

```
y <- tibble(text = x) %>%  
  #establish column names separated by /  
  separate(col = text, into = c("pair", "player_name", "total", "Round_1", "Round_2", "Round_3", "Round_4", "Round_5", "Round_6", "Round_7", "Round_8", "Round_9", "Round_10", "Round_11", "Round_12", "Round_13", "Round_14", "Round_15", "Round_16", "Round_17", "Round_18", "Round_19", "Round_20", "Round_21", "Round_22", "Round_23", "Round_24", "Round_25", "Round_26", "Round_27", "Round_28", "Round_29", "Round_30", "Round_31", "Round_32", "Round_33", "Round_34", "Round_35", "Round_36", "Round_37", "Round_38", "Round_39", "Round_40", "Round_41", "Round_42", "Round_43", "Round_44", "Round_45", "Round_46", "Round_47", "Round_48", "Round_49", "Round_50", "Round_51", "Round_52", "Round_53", "Round_54", "Round_55", "Round_56", "Round_57", "Round_58", "Round_59", "Round_60", "Round_61", "Round_62", "Round_63", "Round_64", "Round_65", "Round_66", "Round_67", "Round_68", "Round_69", "Round_70", "Round_71", "Round_72", "Round_73", "Round_74", "Round_75", "Round_76", "Round_77", "Round_78", "Round_79", "Round_80", "Round_81", "Round_82", "Round_83", "Round_84", "Round_85", "Round_86", "Round_87", "Round_88", "Round_89", "Round_90", "Round_91", "Round_92", "Round_93", "Round_94", "Round_95", "Round_96", "Round_97", "Round_98", "Round_99", "Round_100"), sep = "/")  
  #remove extra lines from beginning and end  
  slice(4:n()-1) %>%

       Round_5 = as.numeric(Round_5),
       Round_6 = as.numeric(Round_6),
       Round_7 = as.numeric(Round_7),
       pair = as.numeric(pair)) %>%
#finding the mean for opponents scores of all rounds and outputting as a new column
mutate(avg_opp = rowMeans(select(., Round_1, Round_2, Round_3, Round_4, Round_5, Round_6, Round_7), na.rm = TRUE))
#selecting relevant columns
  select(player_name, player_state, total, score, avg_opp)

```

```
## Warning: Expected 20 pieces. Additional pieces discarded in 65 rows [2, 3, 4, 5, 6, 7,
## 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, ...].
```

```
## Warning: Expected 20 pieces. Missing pieces filled with 'NA' in 2 rows [1, 67].
```

```
write.csv(y, "607_Project1.csv")
```

Conclusion:

Using tidyverse, I was able to extract and organize the data into columns that allows the players names, state, total number of points, pre-rating, and average pre chess rating of opponents easily read. In the future, we can perform the same operations on this Tournament data over multiple years, and use that to see how players perform over time.
